

APPENDIX:

The Appendix includes the following item(s):

- a new or amended Abstract of the Disclosure

ABSTRACT OF THE DISCLOSURE

A shoplifting-prevention security device includes a flexible flat substrate (1) having an inductor (2) and a capacitor (3) which form a resonant circuit, the plates of the capacitor being separated by a layer of dielectric material. Moreover, at least one zone (A) of the material can be used to establish a short circuit between the plates in order to deactivate the device. In addition, at least one face of the above-mentioned substrate is provided with a rigid part (B) having a contour (Bc) which surrounds the zone(s) (A) provided for the purpose of deactivation.
